

IMAGE PRINTING SYSTEM

Abstract

An image printing system is a system which forms images continuously on a long photosensitive material. The image printing system includes an inputting unit for making reservations for cutting of the photosensitive material by the unit of order. The reserved orders for which a cut is reserved by using the inputting unit are memorized in a RAM. The photosensitive material is cut by a paper cutter at a point behind a place where the formation of images is complete for the reserved order.
